

South Putnam Animal Hospital, PLLC
230b Baldwin Place Road
Mahopac, NY 10541
845-628-1834

We are looking forward to seeing you and your dog for his/her surgical appointment. Please arrive between 9 and 9:15am. You will need to be present while the doctor performs your pet's physical examination, so allow about an hour for the admitting process.

In order to make your pet's admission to the hospital easier, we ask that you read the enclosed materials and fill out the forms ahead of time. The first two pages asks for information about you and your pet. If your pet has had any testing or vaccinations in the past, please fill in the information and bring copies of their medical records with you to the appointment.

Your Animal Welfare League certificate entitles you to get Rabies and Distemper vaccinations for your pet at a substantial discount, and we recommend these vaccinations for all cats. In addition to Rabies and Distemper vaccination, for cats that go outdoors we recommend vaccination against Feline Leukemia virus (FeLV). Feline leukemia (FeLV) and feline immunodeficiency virus (FIV) testing is recommended for all cats. Please indicate which of these vaccines you would like for your pet on the appropriate form.

Also in your packet is a consent form for pre-anesthetic blood testing, which can be done here at the hospital prior to surgery, and is recommended to provide additional information about your pet's overall health. A fecal (stool) examination for intestinal parasites is important for both dogs and cats and should be performed at least once yearly.

We appreciate your time and patience in filling out the enclosed forms. The requested information will help expedite the admission process while ensuring the best possible medical care for your pet. Please be sure to bring the completed forms as well as your Animal Welfare League Certificate and a copy of your pet's vaccine history the morning of your pet's surgery. You can also fax these records to us ahead of time at (845) 628-1896 or email them to: frontdesk@spahvet.com.

Your pet should not have anything to eat after 8:30pm the night before surgery. Normal access to water is fine. Please do not hesitate to call our office with any questions at (845) 628-1834. We look forward to seeing you!

Sincerely,
The Doctors and Staff

Felv/FIV and Vaccine Consent Form

Feline Leukemia (Felv) and Feline Immunodeficiency virus (FIV) are two highly contagious and potentially fatal diseases in cats. Cats most at risk for these diseases are cats that share food and water bowls, go outdoors, fight, or come from multi-cat households. These diseases are spread between cats through bite wounds and close contact like shared food bowls, as well as from mother to kitten.

Symptoms of these two diseases are similar and include weight loss, poor appetite, dehydration, oral lesions and fever. However, your cat may test positive for either of these two diseases and still not show any symptoms. The best way to determine your cat's FeLV and FIV status is through testing.

Our hospital recommends that all cats be tested and at risk cats (those that go outdoors) be vaccinated against feline leukemia. The test procedure is very quick and simple and the results are available within 10-15 minutes. We can then discuss appropriate disease management or vaccination for your cat. The Feline Leukemia vaccine is given in a 2 part series, so a booster vaccine is required 3-4 weeks after the initial injection. After the initial series the vaccine is boosted on an annual basis.

Please indicate your choice:

Yes, I agree to have a FeLV/FIV test performed on my cat.

No, I do not wish to have my cat tested.

Yes, vaccinate my cat against Feline Leukemia.

No, I do not wish to have my cat vaccinated.

It is recommended that the following vaccines/testing be current. Both the feline distemper/respiratory vaccine and rabies vaccine are given according to your pet's vaccine history and may have 1 year or 3 year duration. If this is the first time your pet is receiving the distemper/respiratory vaccine, a follow-up physical exam and a booster vaccine will be required in 3-4 weeks. Annual fecal (stool) exams to look for intestinal parasites (worms) are recommended for all cats. All kittens are born with round-worms and should be treated with a deworming medication. Adult cats who hunt may contract roundworms and tapeworms when they eat the animals they catch. Our receptionist will be happy to provide an estimate for any services you wish performed on the day of your pet's surgery as well as for any needed follow-up care.

Please indicate below which vaccines/test you would like performed on your cat today by placing a checkmark next to it.

distemper/respiratory

rabies

fecal exam

Pre-Anesthetic Blood Testing Consent Form

The health and safety of your pet is our greatest concern. Some medical conditions may not be detected by a physical examination, so we recommend blood tests to give us more information about your pet's health prior to anesthesia and surgery. By testing blood chemistries we can evaluate the status of your pet's major organs. Many anesthetic drugs are removed from the body by the liver and kidneys, so these tests are of particular importance. Hematology testing, which looks at the blood cells themselves, is also important. We measure red blood cells, which carry oxygen throughout the body, using a test called a packed cell volume (PCV).

These tests help us assess the health of your pet and the level of anesthetic risk. If any of the tests are abnormal, we will discuss our findings with you and may adjust the dose or type of anesthetic used, or even postpone surgery until further testing can be done. If all the tests are normal, while it does not guarantee that your pet will not have a problem with anesthesia, it does tell us that your pet is healthy and in a low-risk category. If you have any questions regarding the blood panel or anesthesia, please ask. The veterinarian or staff will be happy to answer them.

- Please complete the above blood work prior to surgery on my pet. I understand that if my pet is a dog a heartworm blood test will be performed as well prior to anesthesia. If any abnormalities are found, please contact me at the phone number below:

Phone Number

- I have elected to refuse the recommended pre-anesthetic blood work at this time, although I do understand that if my pet is a dog a heartworm blood test will be performed prior to anesthesia.

Microchip consent form

What is a microchip? Microchips are tiny chips about the size of a grain of rice that contain a unique identifying number. Veterinarians and shelters use a hand-held scanner to find the microchip under the skin of the pet and read the number.

Why microchip? Unlike collars and tags that can be lost and tattoos that may fade, microchips are a permanent ID that cannot be lost and never wears out. Most animal shelters and many veterinarians scan stray pets for microchips, which contain a unique number registered in a national database. Through this database, lost pets can be reunited with their families. In addition, pets that travel to foreign countries are often required to have a specific, international standard (also called ISO) microchip placed for identification purposes.

Who can be microchipped? Microchips can be implanted into cats and dogs of any age and size.

How is the microchip implanted? Your veterinarian implants the microchip under the skin over the back of the neck, between the shoulder blades, using a needle similar to the kind used to give vaccinations. Once inserted under the skin, the chip is safe from weather, erosion, and theft. It cannot be seen and has no battery. Once your pet has the microchip implanted, you then access the online database to register your pet's number and your contact information.

How do I get my pet microchipped? Just ask! At South Putnam Animal Hospital we use ResQ international standard (ISO) microchips. They can be implanted at any time - during a regular appointment or when a pet is anesthetized for another procedure. Many owners decide to have their pets microchipped when they are spayed or neutered. Before implanting the chip, we will first scan your pet to make sure they don't already have one - our scanner reads all brands of microchips. Once microchipped, your pet will have better chance at getting home if ever lost.

- Yes, please administer a microchip. No, I am declining a microchip for my pet.
